INTRODUCTION.

This third part of the Report contains the meteorological observations taken during the year 1902 in the Central Observatory of Manila. It is to be noted that the observations of atmospheric pressure, temperature, relative humidity, vapor tension, the direction and force of the wind are hourly, and that between the hours 5 a. m. and 9 p. m. they are read directly, while between the hours of 10 p. m. and 4 a. m. they are taken from the self-registering apparatus. The hourly observations of the direction, form, and quantity of the clouds are made from 5 a. m. to 9 p. m., as may be seen in the tables. Each of the tables of the hourly observations has, besides, the respective hourly, daily, and monthly means. The extreme daily values of each of the elements together with the hours when the extremes occurred are brought together in a separate table. As to the other atmospheric elements, it is to be noted that the observations on ozone are taken twice a day, at 6 a. m. and 6 p. m., and the ground temperature once a day, at 8 a. m., on three thermometers at the depths of 25 cm., 50 cm., and 1 m., respectively.

The observations of the atmospheric pressure have not been corrected for gravity: the correction for this would be -1.72 mm.

All the observations in this report are expressed in the metric system, thus continuing in this what has been the system followed up to the present in this Observatory, as it was allowed us to do when the Philippine Meteorological Service was reorganized and the observations are arranged by months, as was done in the annual Spanish report.

A general summary of the meteorological data deduced from twenty-four daily observations during the year 1902 may be found at the end of the Bulletin for December, 1902.

A fourth part will follow containing the magnetic observations made at the Central Observatory.

A fifth part will be devoted to the observations made at the secondary stations of the Archipelago.
